

MastMinder WM-4 Wireless Module data sheet

The **MastMinder® WM-4** wireless module is designed to enable an upgrade to existing MastMinder installations to integrate with the wireless version of the MastMinder Mbus site network.

The **MastMinder® WM-4** is typically installed adjacent to the existing MastMinder M400 unit and also next to each IO Unit in each generator. It is physically connected to the existing equipment via a short length of Mbus network cable.

The previous MastMinder MBUS network cable interconnecting all the units is now eliminated.

- Eliminates any possibility of multiple equipment lightning induced damage via the Mbus network cable
- 35mm DIN rail or bulkhead mounting
- Faster installation time due to no interconnect network cable installation
- Zero changes to any existing logic or user interfaces

Typical Installation
